MINI-CLIK® RAIN SENSOR
INSTALLATION CARD

Introduction
In most installations, the Mini-Clk acts as a switch that breaks the circuit to an irrigation system’s solenoid valves in response to rain. This allows the timer to advance as scheduled, but keeps the valves from opening the water flow. Once the Mini-Clk has dried sufficiently, the switch closes again to allow normal operation.

The Mini-Clk has 25’ (8 m) of cable attached to it. The cable terminates with blue leads. These leads will be wired to the SEN terminals or SEN and SEN COM terminals of the controller. The order in which they are wired does not matter (Figure 1).

For model Mini-Clik-C: The conduit acts as the mounting support for the unit. Therefore, place and mount the conduit to allow for the desired sensor location as described in the main instructions for the standard model. Be sure to support the conduit sufficiently along its various lengths.

Helpful Hints for Mounting
A. When looking for a suitable location (such as on the side of a building or post), the closer the Mini-Clk is to the controller, the shorter the wire run will be. This will minimize the chance for wire breaks.

B. The ideal location for mounting is not always the most practical location. In the case where a compromise must exist (such as a low location on a side wall rather than a preferred higher location), note that the Mini-Clk will still work because it will always receive some rainfall — it just will not be as accurate in its gauging as it could be.

C. As described in the “Operation” section of this manual, “reset rate” refers to the amount of time it takes the Mini-Clk to dry out sufficiently for the sprinkler system to be allowed to come back on. The mounting location will affect this rate and must be taken into consideration should extreme conditions exist. For example, mounting the Mini-Clk on a very sunny, southern end of a building may cause the Mini-Clk to dry out sooner than desired. Similarly, mounting on the northern end of a building with constant shade may keep the Mini-Clk from drying soon enough.

Once the Mini-Clk is mounted, run the wire to the controller. Fasten it every few feet with wire clips or staples for best results. If an extension to the wire provided is needed, use the following table to determine the minimum wire gauge needed:

<table>
<thead>
<tr>
<th>Extension Needed</th>
<th>Minimum Wire Gauge</th>
</tr>
</thead>
<tbody>
<tr>
<td>0–100’ (15–30 m)</td>
<td>18 AWG (1 mm)</td>
</tr>
<tr>
<td>&gt;100’ (&gt;30 m)</td>
<td>16 AWG (1.3 mm)</td>
</tr>
</tbody>
</table>

Wiring to Your Irrigation System

IMPORTANT: The standard model Mini-Clk is sold and designed for hooking up to 24-volt irrigation controllers only. For wiring to 110- or 220-volt irrigation controllers, consult your distributor or the factory. All wiring must conform to National Electrical Code or applicable local codes.

For model Mini-Clik-C: WARNING! This unit is designed to be installed in conjunction with 24 VAC circuits only. Do not use with 110 or 220 VAC circuits.

Other Controllers

The two most common situations are shown below. For non-standard wiring situations, consult your distributor or request our non-standard wiring information packet.
24-Volt Solenoid Valves Only (No Booster Pump) — Figure 3
With the two wires from the Mini-Clik at the controller, locate the “common ground” wire of the solenoid valves. If it is connected to the common terminal on the controller, disconnect it. Attach one wire of the Mini-Clik to the “common” terminal (usually marked “C”) on the controller. Attach the other wire of the Mini-Clik to the common wire leading to the valves. Note: The common wire to the valves does not have to be interrupted at the controller. The Mini-Clik can be wired anywhere along the common wire line (an example would be at the valve box location).

Operation Check to Verify Correct Wiring
Turn on one zone of the irrigation system that is visible while you are in reach of the Mini-Clik. Manually depress the spindle at the top of the Mini-Clik until you hear the switch “click” off. The sprinkler zone should stop instantaneously. If it does not, check wiring for correctness. It is not necessary to “wet” test the Mini-Clik, although it will test the operation accurately, if desired.

Adjustments and Operation
The Mini-Clik can keep the irrigation system from starting or continuing after rainfall quantities of 1/8", 1/4", 1/2", and 3/4”. To adjust it to the desired shut-off quantity, rotate the cap on the switch housing so that the pins are located in the proper slots (Figure 4). Do not forcibly twist the cap, as this could break the pins. The time that it takes the Mini-Clik to reset for normal sprinkler operation after the rain has stopped is determined by weather conditions (e.g., wind, sunlight, humidity). These conditions will determine how fast the hygroscopic discs dry out. Since the turf is also experiencing the same conditions, their respective drying rates will roughly parallel each other. This means when the turf needs more water, the Mini-Clik is already reset to allow the sprinkler system to go at the next scheduled cycle. There is an adjustment capability on the Mini-Clik that will slow down the reset rate. By turning the “vent ring” (Figure 4) to completely or partially cover the ventilation holes, the hygroscopic discs will dry more slowly. This adjustment can compensate for an “overly sunny” installation location, or peculiar soil conditions. Experience will best determine the ideal vent setting.

Bypassing the Sensor
On Hunter controllers, move the rain sensor switch to “Bypass.” Note: Using the “manual” switch on non-Hunter controllers typically will not bypass the sensor.

Maintenance
There is no required maintenance for the unit. The Mini-Clik does not have to be removed or covered for winterizing purposes.

Troubleshooting
Follow these simple checks first before assuming the unit is bad and replacing it. If the system will not come on at all:
A. Check wiring for correctness (see “Operation Check to Verify Correct Wiring”).
B. Check the sensitivity setting (move the cap to a more sensitive setting).
C. Is the rainfall actually hitting the Mini-Clik? Check for obstructions to rainfall (e.g., overhangs, trees, or walls).
