Installing the Soil-Clik Probe

1. Soak lower two-thirds of probe for 30 minutes before installing. Do not allow water to cover the top cap where wires are connected.

2. Use ½” (12 mm) PVC pipe to make a vertical hole to desired depth in the soil (outside diameter ¾” (22 mm)). Do not install probe horizontally.

3. Mix a slurry of native soil and water, and pour into the hole.

4. Place sensor in vertical position (do not tilt more than 45°) at bottom of hole.

Do not install probe horizontally.

Visit hunter.direct/soilclik for complete setup information.
Connecting the Probe to the Soil-Clik Module

Connect the gray/black probe wires to the two gray Soil-Clik module wires with waterproof connections (polarity is not important in this system).

Connecting the Probe to NODE-BT

Cut the clear waterproof seal on the gray two wires connected to the controller. Connect the gray/black probe wires to the two gray NODE-BT wires with waterproof connections (polarity is not important in this system). The Soil-Clik module is not used with NODE-BT installations.

Use only 18 AWG (1mm²) or larger direct burial rated wire, up to 1,000' (300 m) from the module.

Avoid high-voltage lines and other sources of electrical interference.
