The Solar Sync is a sensor system that, when connected to a compatible Hunter controller, will automatically adjust your controller watering based upon changes in local climate conditions. The Solar Sync utilizes a solar and temperature sensor to measure on-site weather conditions used to determine evapotranspiration (ET), or the rate at which plants and turf use water. In addition, the Solar Sync sensor includes a Hunter Rain-Clik® and Freeze-Clik® sensor that will shut down your irrigation system when it rains and/or during freezing conditions.

The result is a new water-efficient irrigation product that promotes water conservation and healthier plants. You simply program your controller like you normally would, and the Solar Sync takes over from there, eliminating the need to manually adjust your watering schedule.

System Overview and Operation

The Solar Sync system is easily installed on any compatible Hunter irrigation controller (see controller Owner’s Manual or application guide to verify compatibility). The system consists of a sensor and receiver. The receiver is only necessary when accompanied by a wireless sensor. The sensor must be placed in an area where it can receive full sun and rain exposure. The receiver is installed next to or attached to your Hunter controller. The Solar Sync sensor measures solar radiation and temperature and calculates the daily evapotranspiration (ET) factor for irrigation. This represents the amount of water lost by the plants due to local climatic conditions, which needs to be replaced by irrigation. The Solar Sync sensor also includes a Hunter Rain-Clik rain sensor that will automatically shut down the irrigation system during rain events, thus preventing unwanted irrigation when it is raining.

Enter a midsummer watering program in your controller per the programming instructions in the Owner’s Manual provided with your controller. The Solar Sync receives data from the sensor and applies it daily to the controller’s water schedule by adjusting the controller’s programmed irrigation run times through the seasonal adjustment feature in the controller.
Choosing the Sensor Location

Using the screws provided, mount the Solar Sync sensor on any surface where it will be exposed to unobstructed sun and rainfall, but not in the path of sprinkler spray.

The sensor gutter mount can also be used as an optional mounting method. The gutter mount allows the sensor to be mounted directly to the edge of a gutter.

⚠️ Note
Place the Solar Sync sensor where it can receive full sun.
System Installation

Solar Sync System Components

The Rain-Clik will keep the irrigation from starting or continuing during rainfall. No adjustment or calibration is required for the Rain-Clik sensor. The Rain-Clik uses patented Quick Response® technology that will shut the system off during the first few minutes of rain. The only adjustment that is necessary is the vent ring that will either slow down or speed up the time at which the sensor dries out and the system is turned back on. Opening the vent will speed up the dry-out time and closing the vents will slow down the dry-out time.

In addition, the Solar Sync’s built-in temperature sensor provides system shutdown when freezing conditions occur. At approximately 37°F (3°C) and below the Solar Sync will command the controller to shut down. A “sensor off” indication will be displayed on your controller when the sensor is active. When the temperature rises above 37°F (3°C), automatic irrigation will be reactivated.
Wireless Solar Sync System Components

The Wireless Solar Sync includes a downward-facing antenna that communicates with the receiver.

1. Solar radiation sensor
2. Rain-Clik ring
3. Vents
4. Quick Response
5. Wireless antenna

Wireless Solar Sync Receiver

The Solar Sync receiver is designed to be mounted on the wall next to the controller, or mounted in an available knockout on the side of the controller.
System Installation

Installing the Sensor

The Solar Sync sensor can be mounted using the wall bracket, or the gutter mount. To mount the Solar Sync using the wall bracket (A), use the screws provided to attach the sensor.

To mount the Solar Sync using the gutter mount (B), tighten the locking screw over the edge of a rain gutter.

The sensor needs to be oriented upright (C) and the swivel bracket can be moved for mounting on angled surfaces. Loosen the locknut and screw to install at the desired angle and then retighten.

Installing the Receiver

The Solar Sync receiver (A) can be installed either on the wall using the mounting bracket (C) provided, or by using an available knockout in the controller cabinet. Mount the receiver to the wall using the screws provided near your controller.

Mount the receiver on the side of your controller using the extender (B) provided in any available knockout.
Maintaining the Sensor

The Solar Sync sensor is designed for outdoor use, but must be kept clean to function correctly. We recommend wiping the dome covering the solar radiation sensor every six months. Do not use harsh chemicals or abrasives on the dome.

Bypassing the Sensor

If the Rain Sensor or Freeze Sensor is preventing system operation, SENSOR OFF will be displayed on the controller’s display. To disable the rain and freeze sensor, move the RAIN SENSOR switch on the controller to BYPASS. This allows you to operate your system during rain and freeze conditions. The Solar Sync will continue to make adjustments to your controller’s watering schedule. The controller’s Rain Sensor switch should be in the ACTIVE position for the Rain Sensor and Freeze Sensor to interrupt watering during rainy and/or freezing conditions.
System and Controller Wiring

X-Core with Wired Solar Sync

Compatible system: SOLAR-SYNC-SEN
The X-Core controller has built-in Solar Sync control, allowing the sensor be wired directly to the sensor terminals inside the controller. Mount the sensor using the hardware included.

X-Core with Wireless Solar Sync

Compatible system: WSS-SEN
The X-Core controller has built-in Solar Sync control, allowing the receiver be wired directly to the sensor terminals inside the controller. Mount the receiver to the wall with the included wall mounting bracket and hardware. Mount the sensor using the hardware provided.
**Pro-C or PCC with Wired Solar Sync**

*Compatible system: SOLAR-SYNC-SEN*

The Pro-C or PCC controller has built-in Solar Sync control, allowing the sensor to be wired directly to the sensor terminals inside the controller. Mount the sensor using the hardware included.

**Pro-C or PCC with Wireless Solar Sync**

*Compatible system: WSS-SEN*

The Pro-C or PCC controller has built-in Solar Sync control, allowing the receiver to be wired directly to the sensor terminals inside the controller. Mount the receiver in the knockouts provided on the side of the controller or mount the receiver and sensor to the wall with the wall mounting bracket and hardware provided.
ICC2 with Wired Solar Sync

Compatible system: SOLAR-SYNC-SEN
The ICC2 controller has built-in Solar Sync control, allowing the sensor to be wired directly to the sensor terminals inside the controller. Mount the sensor using the hardware included.

ICC2 with Wireless Solar Sync

Compatible system: WSS-SEN
The ICC2 controller has built-in Solar Sync control, allowing the receiver to be wired directly to the sensor terminals inside the controller. Mount the receiver in the knockouts provided on the side of the controller or mount the receiver and sensor to the wall with the wall mounting bracket and hardware provided.
I-Core with Wired Solar Sync

Compatible system: SOLAR-SYNC-SEN
The I-Core controller has built-in Solar Sync control, allowing the sensor to be wired directly to the sensor terminals inside the controller. Mount the sensor using the hardware included.

I-Core with Wireless Solar Sync

Compatible system: WSS-SEN
The I-Core controller has built-in Solar Sync control, allowing the receiver to be wired directly to the sensor terminals inside the controller. Mount the receiver in the knockouts provided on the side of the controller or mount the receiver and sensor to the wall with the wall mounting bracket and hardware provided.
System and Controller Wiring

ACC with Wired Solar Sync

Compatible system: SOLAR-SYNC-SEN
The ACC controller has built-in Solar Sync control, allowing the sensor be wired directly to the sensor terminals inside the controller. Mount the sensor using the hardware included.

ACC with Wireless Solar Sync

Compatible system: WSS-SEN
The ACC controller has built-in Solar Sync control, allowing the receiver be wired directly to the sensor terminals inside the controller. Mount the receiver in the knockouts provided on the side of the controller or mount the receiver and sensor to the wall with the wall mounting bracket and hardware provided.
ACC2 with Wired Solar Sync

Compatible system: SOLAR-SYNC-SEN
The ACC2 controller has built-in Solar Sync control, allowing the sensor be wired directly to the sensor terminals inside the controller. Mount the sensor using the hardware included.

ACC2 with Wireless Solar Sync

Compatible system: WSS-SEN
The ACC2 controller has built-in Solar Sync control, allowing the receiver be wired directly to the sensor terminals inside the controller. Mount the receiver in the knockouts provided on the side of the controller or mount the receiver and sensor to the wall with the wall mounting bracket and hardware provided.
Setup and Programming

Programming the Controller

Program your Hunter controller as specified in the Owner’s Manual. When setting station run times, enter the time that would normally be programmed during the peak summer watering season. The Solar Sync is designed to adjust all run times daily based upon on-site weather conditions. This is done through the seasonal adjustment feature on your controller. We recommend that all programming be conducted with the controller seasonal adjustment set at 100%.

Note

Set station run times for peak summer watering with seasonal adjustment set at 100%.

Making Adjustments

After programming the controller to use Solar Sync, we recommend that you leave it alone for a few days to gather sun and temperature data. If necessary, there are two ways to make adjustments:

• If you find an individual zone is wetter or drier than the rest of the site, simply increase or decrease the amount of run time entered in the controller for that station.

• When making adjustments to program run times, make sure to reset the seasonal adjust valve to 100%. Solar Sync will make the appropriate adjustment automatically based on measured weather conditions.

• If your landscape is wetter or drier than it should be, use the controller to increase or decrease run times.
Making Adjustments (continued)

After Solar Sync has been installed and programmed, we recommend allowing the system to run for a few days at the initial setting. Because of the variation in site conditions (including sensor location, amount of direct sunlight available to the sensor, reflective heat from surrounding structures, etc.), the initial setting may require adjustment to achieve the desired performance.

The calibration of the Solar Sync to a particular site can easily be accomplished by adjusting the Region and/or Water Adjustment settings. The instructions below outline this process:

1. Allow system to operate at initial settings for a minimum of three days.

2. Observe the Seasonal Adjust on the controller. If the Seasonal Adjust amount appears to be lower or higher than expected for that time of year, the Solar Sync settings need to be adjusted.

A. Seasonal Adjust too low – Make sure the controller dial is in the RUN position. Increase the value on the Water Adjustment scale (10 is max). Once the setting is changed, the controller will immediately be updated with the new Seasonal Adjustment %. Increase the Water Adjustment setting until the desired Seasonal Adjust % is shown. If you max out the Water Adjustment scale at 10 and still require more Seasonal Adjust, move down to the next lower Region (from Region 4 to 3, for example).

B. Seasonal Adjust too high – Make sure the controller dial is in the RUN position. Decrease the value on the Water Adjustment scale (default setting is 5). Once the setting is changed, the controller will immediately be updated with the new Seasonal Adjust %. Decrease the Water Adjustment setting until the desired Seasonal Adjust % is shown. If you minimize the Water Adjustment scale down to 1 and still require a reduction in Seasonal Adjust, move up the next Region (from Region 2 to 3, for example).
Calibration and Setup Period

The table below will assist you in identifying the region in which you live. There are four basic ET regions, each with descriptions of the region, along with typical ET and temperature characteristics. If possible, we recommend that you choose the region based upon average July ET or peak summer ET.

<table>
<thead>

</tr>
</tbody>
</table>

* For Southern Hemisphere locations, use the month of January.
Station Run Times

It is important to understand that Solar Sync provides a global seasonal adjustment to the controller. This means that all station run times will be modified by the seasonal adjust percentage shown. When programming the controller, the run times should be entered that represent peak season watering schedules. If the Solar Sync is adjusting to the appropriate seasonal adjust value but the run time for a particular station appears to be too long or short, adjust the station run time in the controller program.

Controller Run Time in Peak Summer

A

July for Northern Hemisphere

B

January for Southern Hemisphere

Seasonal Adjustment
Controller Compatibility

The Solar Sync is designed for use with Hunter X-Core, Pro-C, PCC, ICC2, I-Core, ACC, and ACC2 controllers.

Specifications

- Power Input: 24 VAC 50/60 Hz (from controller)
- Current draw: 25 mA at 24 VAC
- Non-volatile memory
- Max distance (wired) sensor to controller: 200' (60 m)
- Max distance (wireless) sensor to controller: 800' (240 m)
- Wiring: 18 AWG (1 mm) or 20 AWG (0.8 mm) diameter minimum from the sensor to the controller
- UL Listed
- Direct burial and UV approved

Dimensions

Wired Solar Sync Sensor:
- 3" H x 8¼" W x 1" D (7.6 cm H x 21 cm W x 2.5 cm D)

Wireless Solar Sync Sensor:
- 4½" H x 8¼" W x 1" D (11.7 cm H x 21 cm W x 2.5 cm D)

Solar Sync Receiver:
- 5¾" H x 1½" W x 1" D (13.5 cm H x 3.8 cm W x 2.5 cm D)
FCC Notice

This equipment generates radio frequency energy and may cause interference to radio and television reception. It has been type tested and found to comply with the limits for a Class B computing device in accordance with the specifications in Subpart J of Part 15 of FCC Rules, which are designed to provide reasonable protection against such interference in a residential installation. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient the receiving antenna
- Move the controller away from the receiver
- Plug the controller into a different outlet so that controller and receiver are on different branch circuits

If necessary, the user should consult the dealer or an experienced radio/television technician for additional suggestions. The user may find the following booklet prepared by the Federal Communications Commission helpful: “How to Identify and Resolve Radio-TV Interference Problems.” This booklet is available from the U.S. Government Printing Office, Washington, D.C., Stock No. 004-000-00345-4 (price: $2.00).

This product should not be used for anything other than what is described in this document. This product should only be serviced by trained and authorized personnel.
Specifications, Dimensions, and Notices

Industry Canada Notice

Sensor - IC: 2772A-SSW
Receiver - IC: 2772A-SSWR

Operation is subject to the following conditions:

- This device may not cause harmful interference and
- This device must accept any interference received, including interference that may cause undesired operation

This class B digital apparatus complies with Canadian ICES-003.

The term IC before the certification/registration number only signifies that the Industry Canada technical specifications were met.

CE NOTICE: This notice applies only to models WSS-SEN

Important Notice: Low power RF product operating in 869.700-870.000 MHz band for indoor or outdoor home and commercial use.

CE and Australia Notice

Hunter Industries hereby declares that this remote control device is in compliance with the essential requirements and other relevant provisions of Directive 2014/53/EU.

Declaration of Conformity: We, Hunter Industries Incorporated, 1940 Diamond Street, San Marcos, CA 92078, declare under our own responsibility that the Wireless Solar Sync, model numbers WSSTR and WSSR, to which this declaration refers, conforms with the relevant standards:

Emissions:

• ETSI EN 300 220-1 V3.1.1
• ETSI EN 300 220-2 V3.1.1
• ETSI EN 301 489-1 V2.2.0
• ETSI EN 301 489-3 V2.1.1
• EN 61000-3-2
• EN 61000-3-3

Immunity:

• ETSI EN 301 489-1 V1.4.1
  (per IEC61000-4-2 through IEC61000-4-6, and IEC61000-4-11)

Certificate of Conformity to European Directives

Hunter Industries declares that the irrigation sensor Solar Sync complies with the standards of the European Directives of “electromagnetic compatibility” 2014/30/EU and “low voltage” 2014/35/EU.
